

ABSTRACT

5 A plasma display panel comprising plural kinds of phosphor layers
emitting different colors of fluorescent light, at least one kind of the phosphor
layer being formed of a mixed phosphor obtained by mixing a phosphor having
a surface potential with a negative polarity and a phosphor having a surface
potential with a positive polarity. By using the mixed phosphor, the negative
polarity of the surface potential is changed to the positive polarity, thereby
reducing the discharge error and discharge variation, and improving the
10 quality of display.
